

Varick Agents

Today's AI increases productivity. Tomorrow's will take work off of your plate entirely

How to make your agents own tasks end to end.

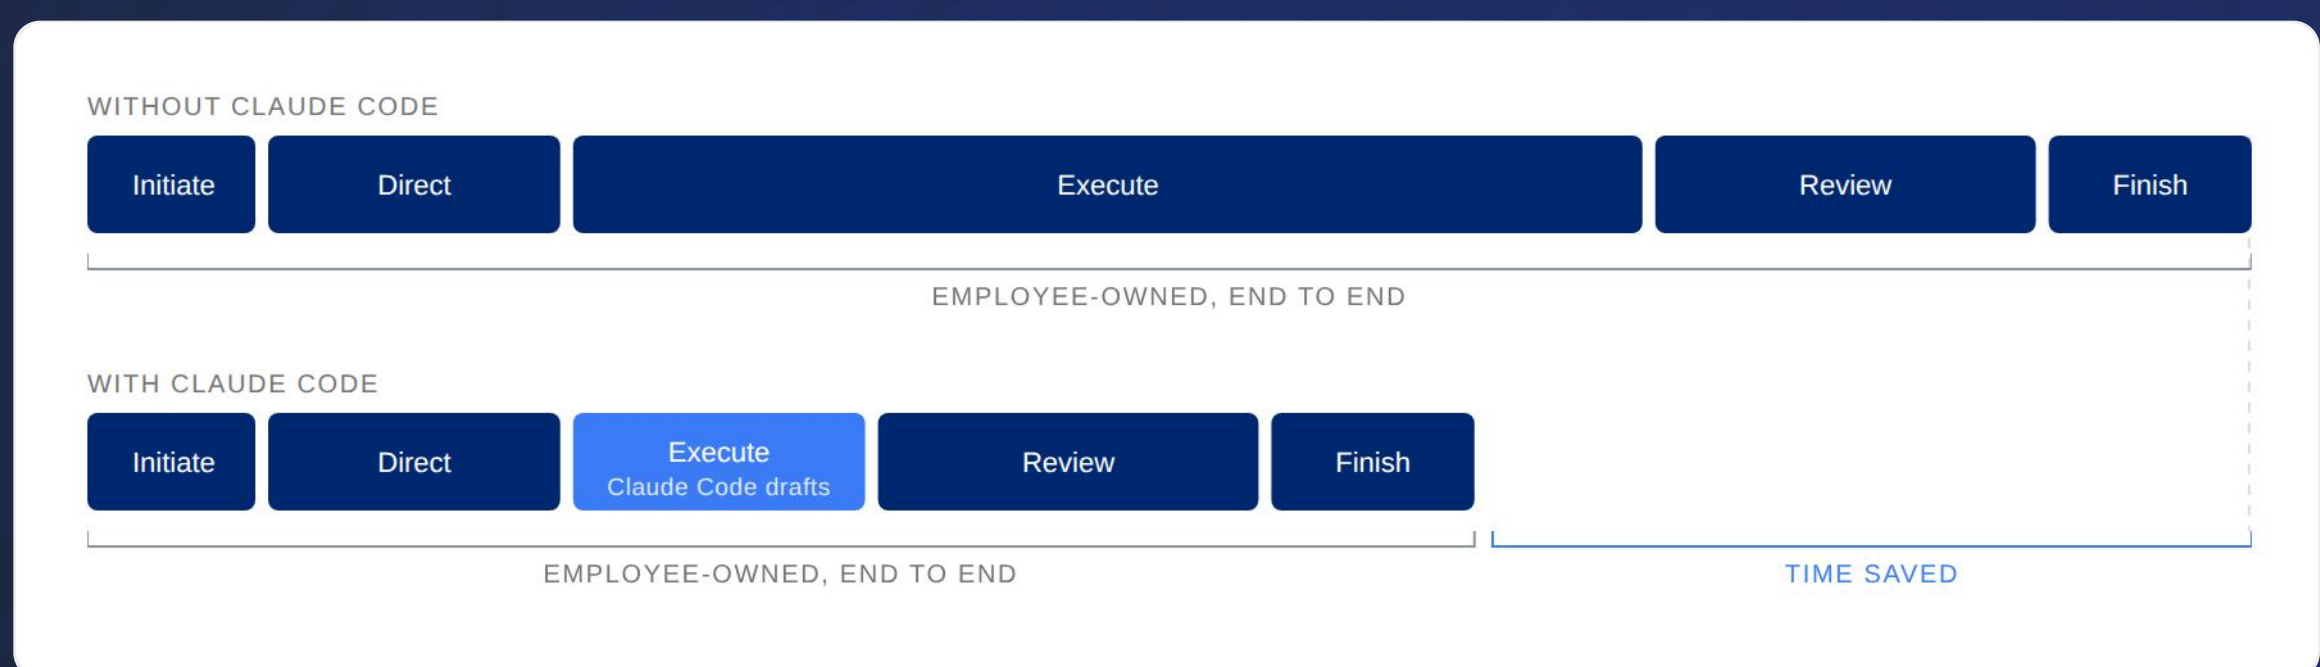

Varick Agents

Faster work is still employee-owned work.

Claude Code can help someone complete a task in less time.

But the employee still has to initiate, direct, review, and finish the work.

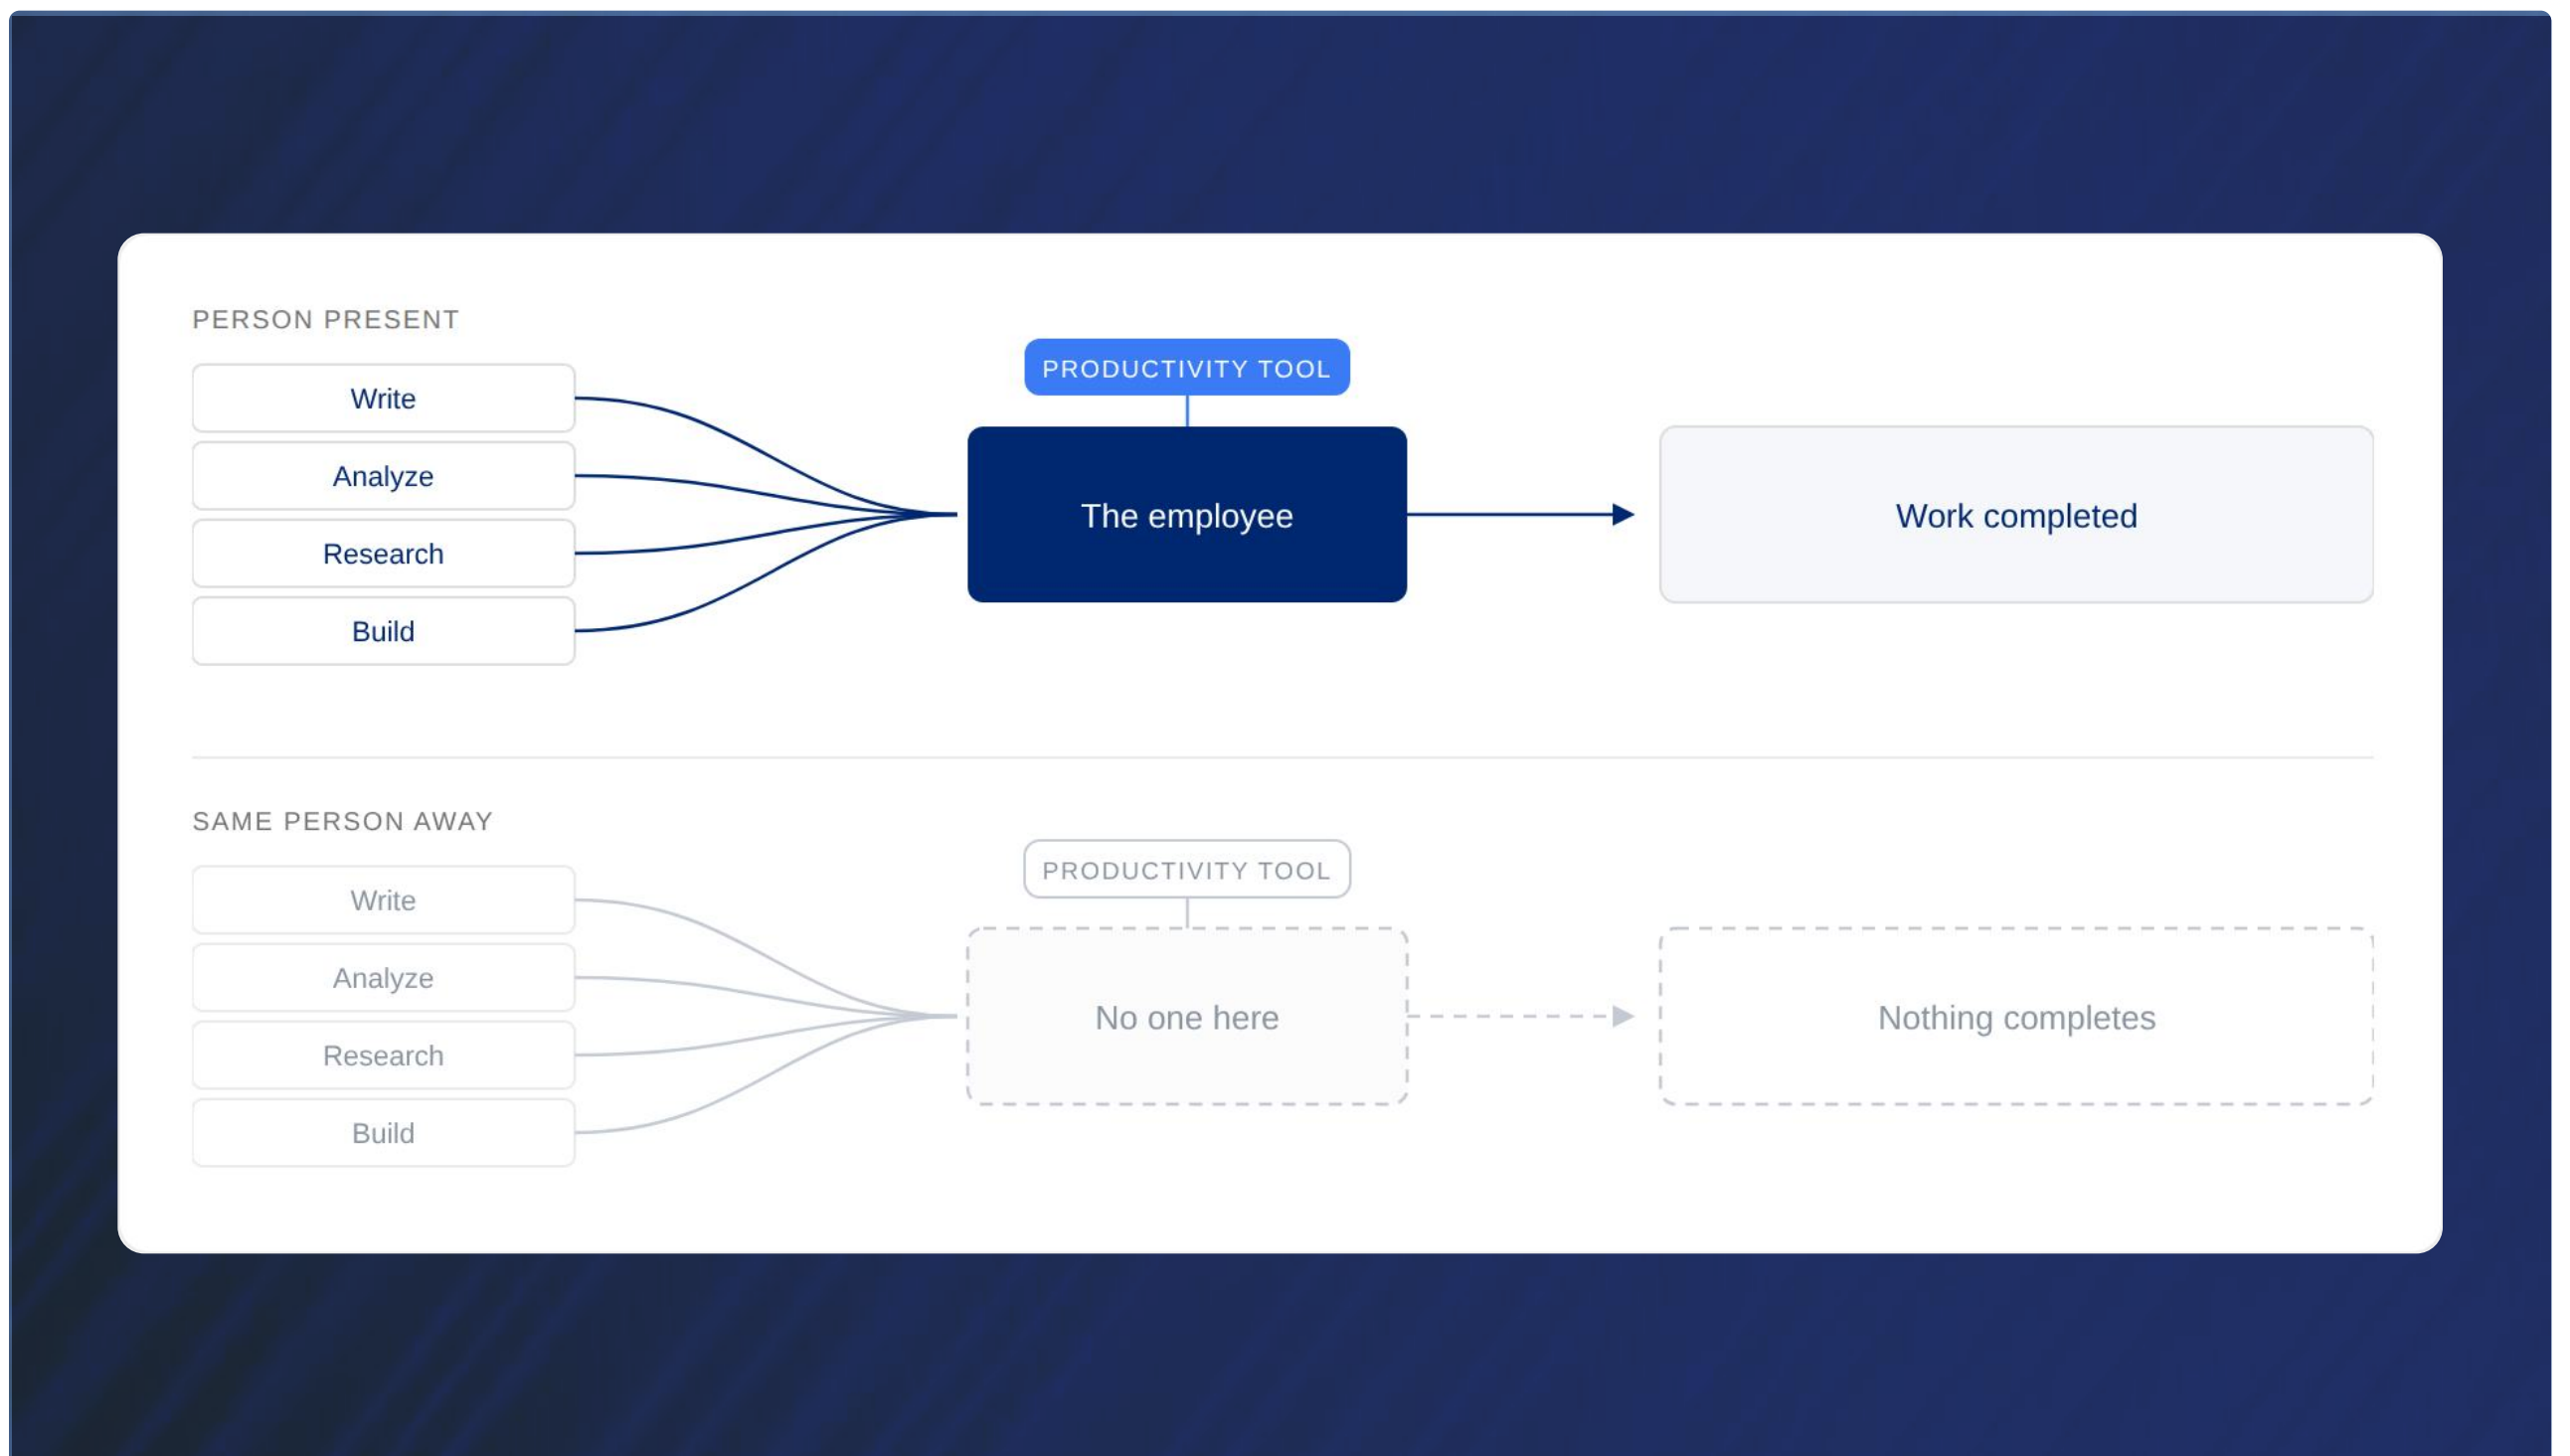

Varick Agents

Productivity tools improve the worker.

They help one person write, analyze, research, or build faster.

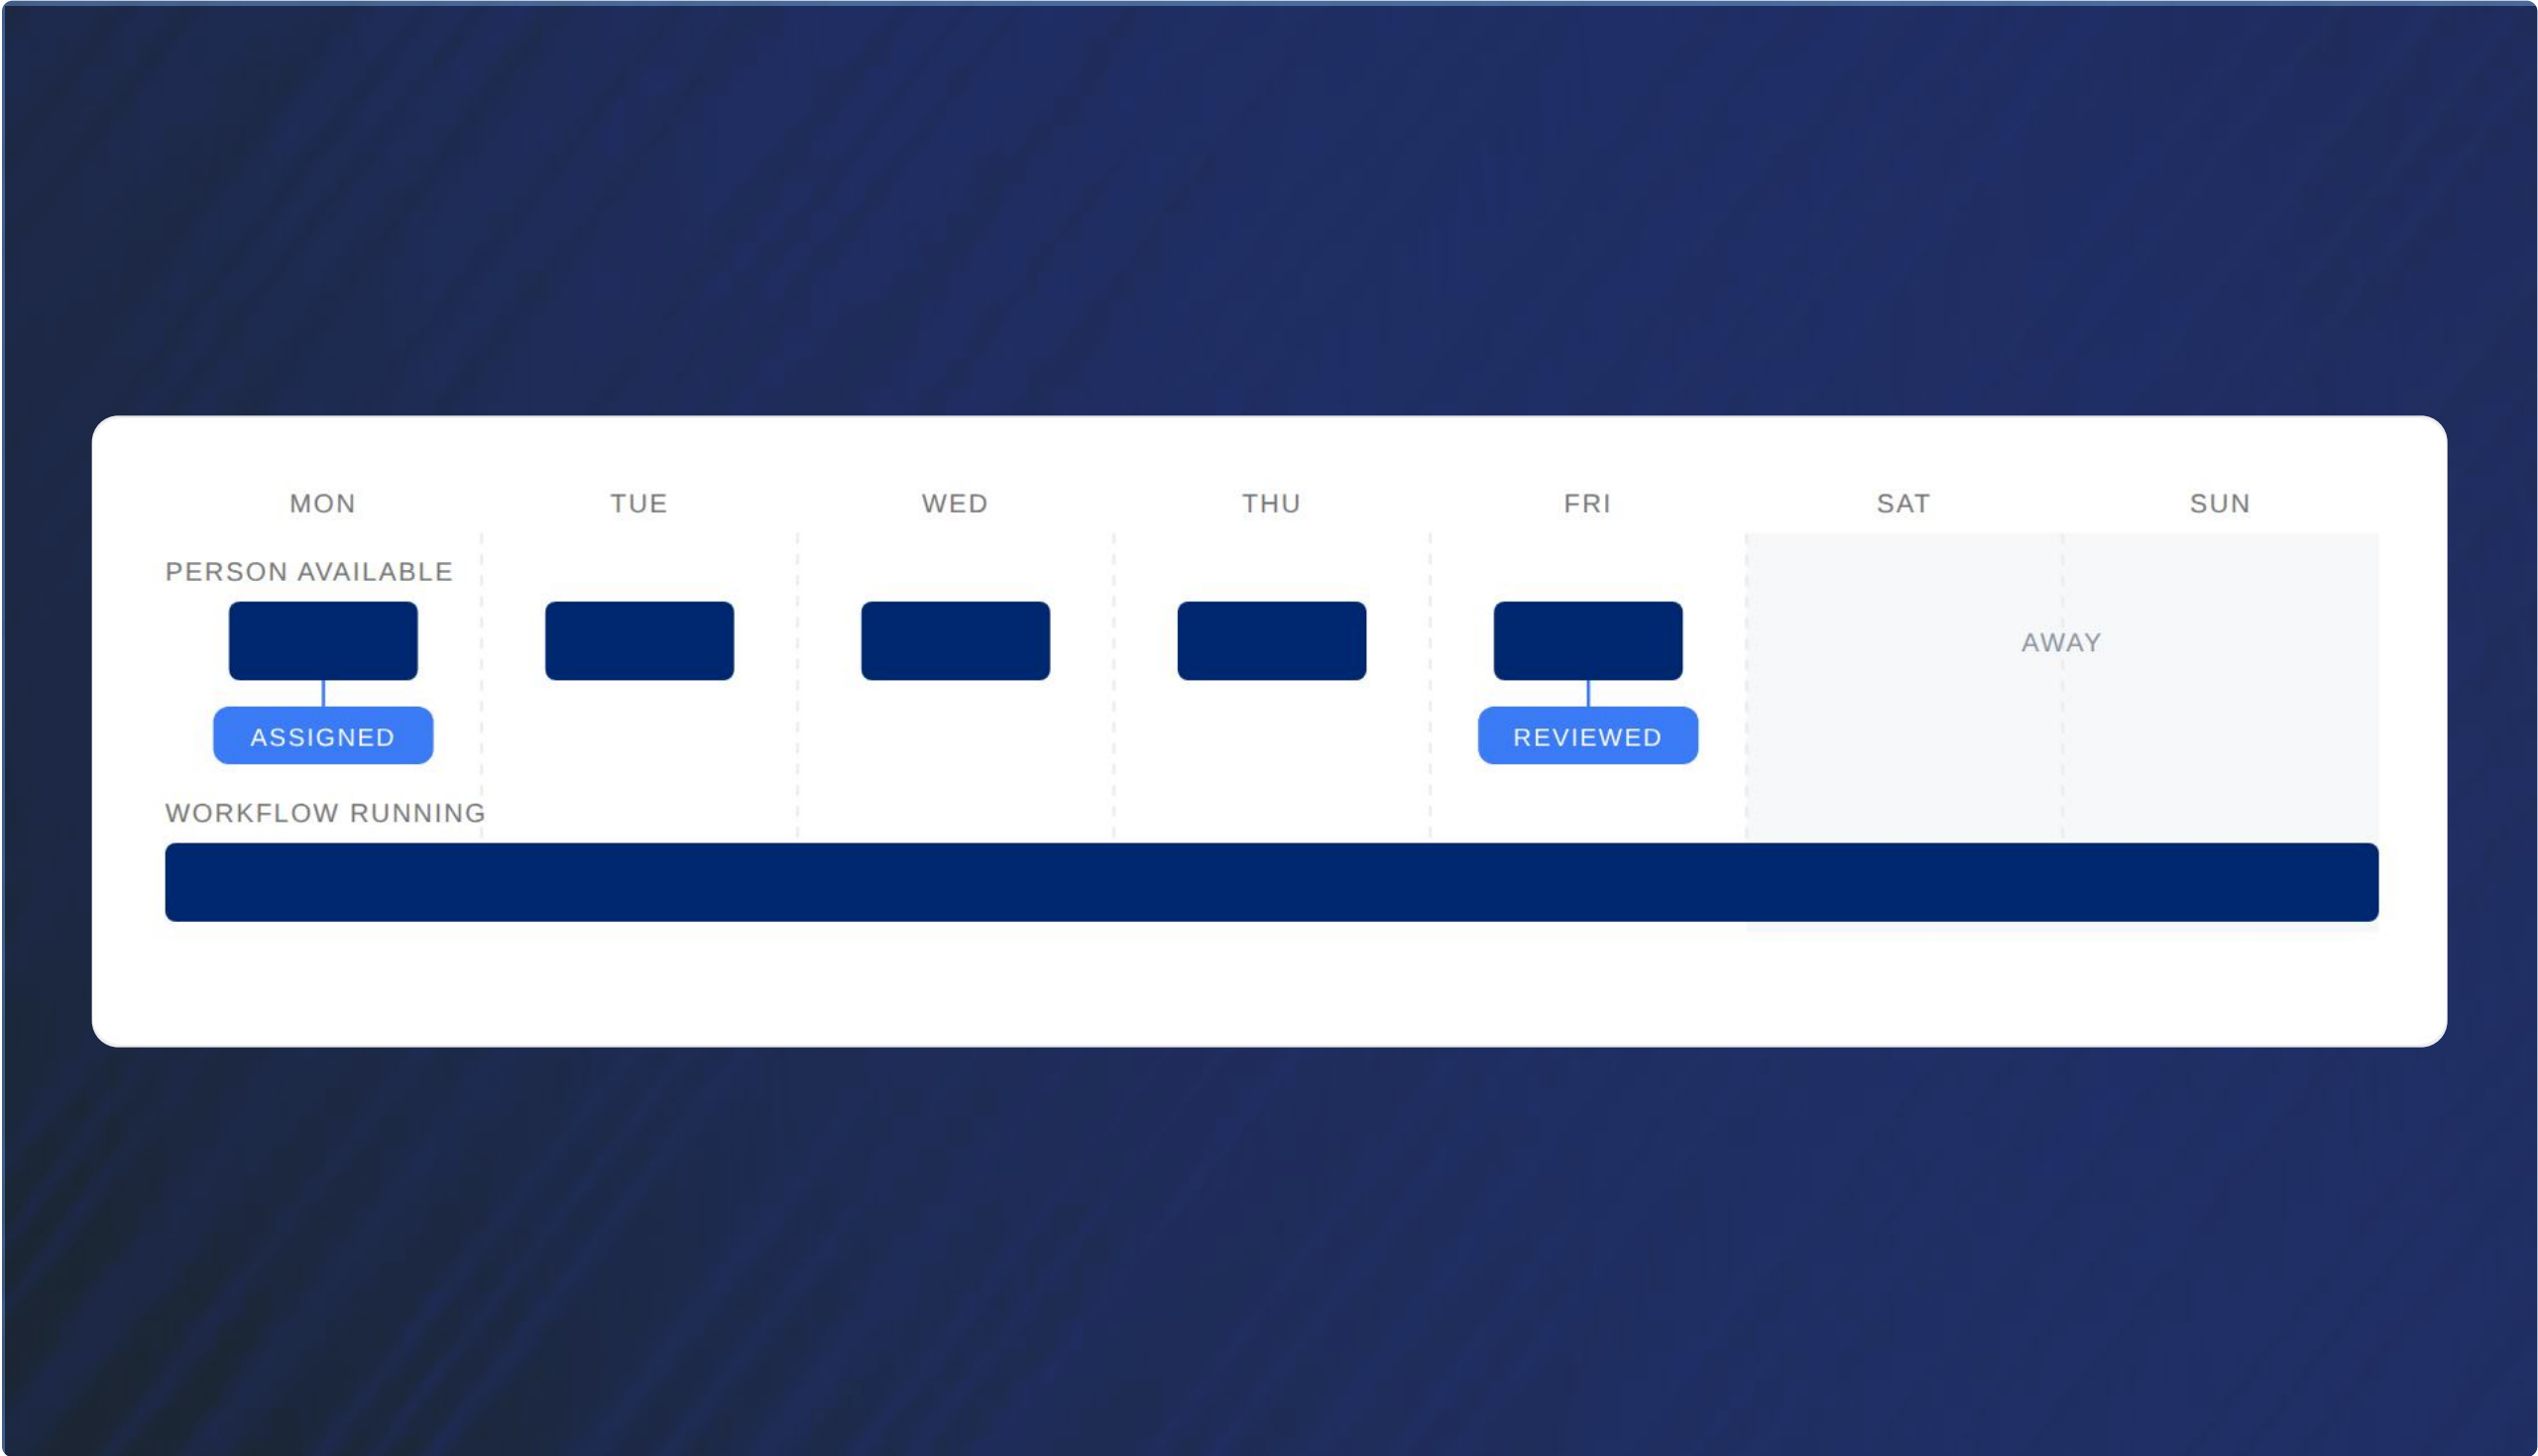

The workflow still depends on that person being present.

Background agents improve the operation.

They are assigned responsibility for a repeatable workflow.

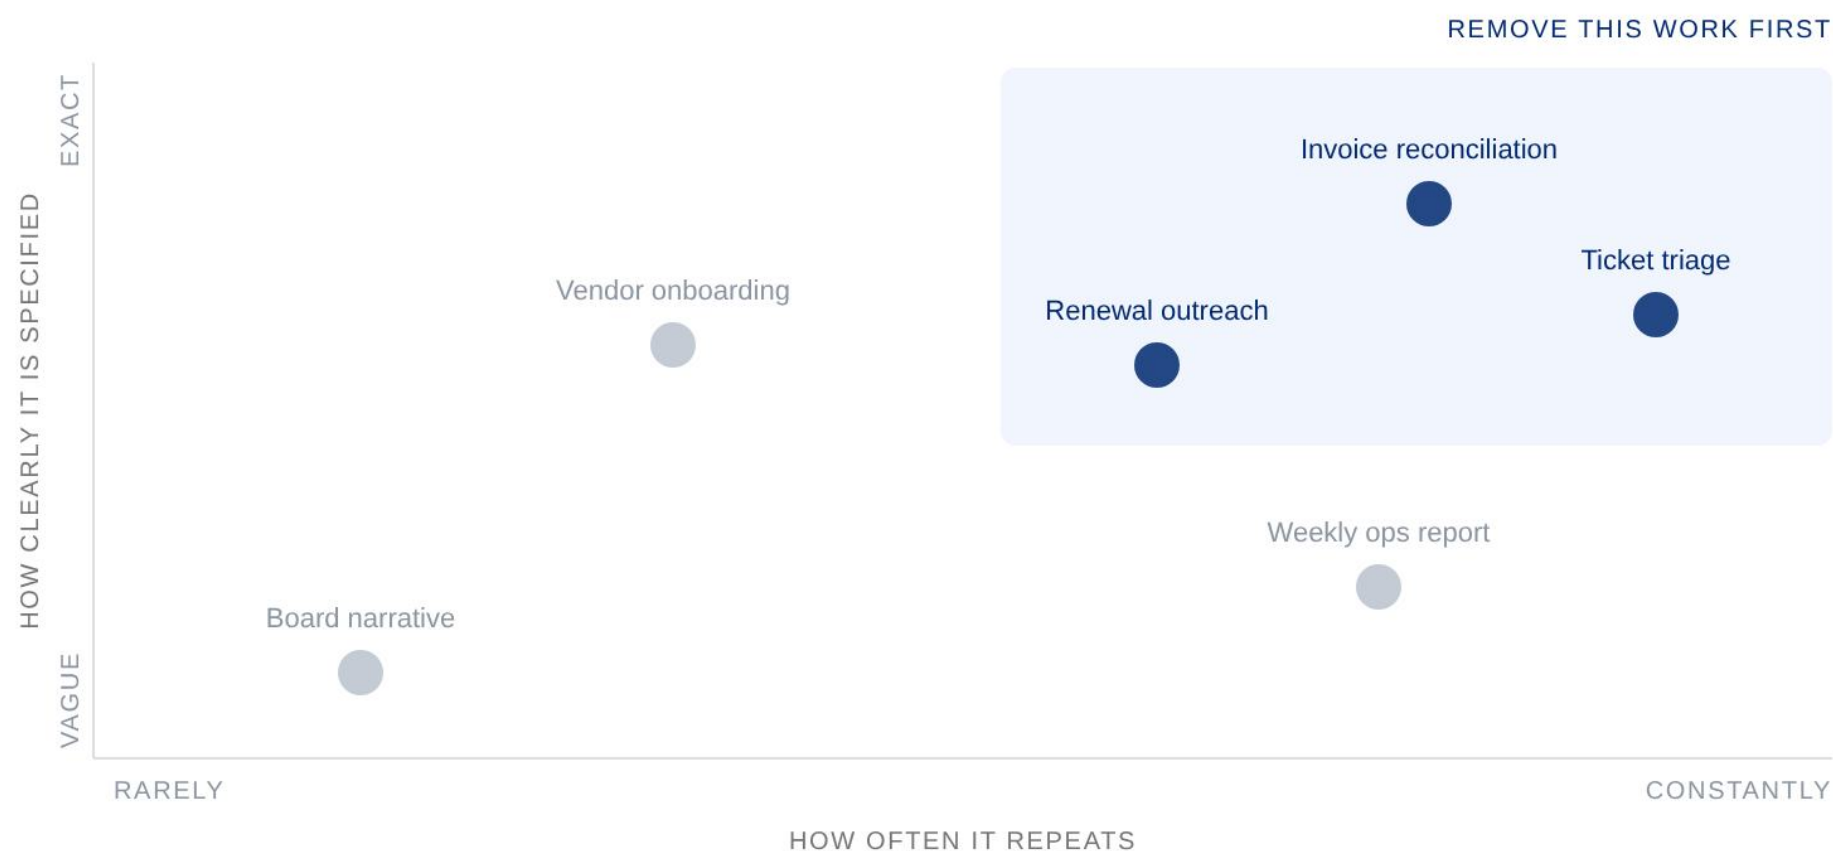

The work continues whether or not an employee is actively prompting the agent.

Start with work that should disappear.

Look for recurring processes with clear inputs, decisions, actions, and exceptions.

Only in these types of workflows will an agent yield sufficient ROI.

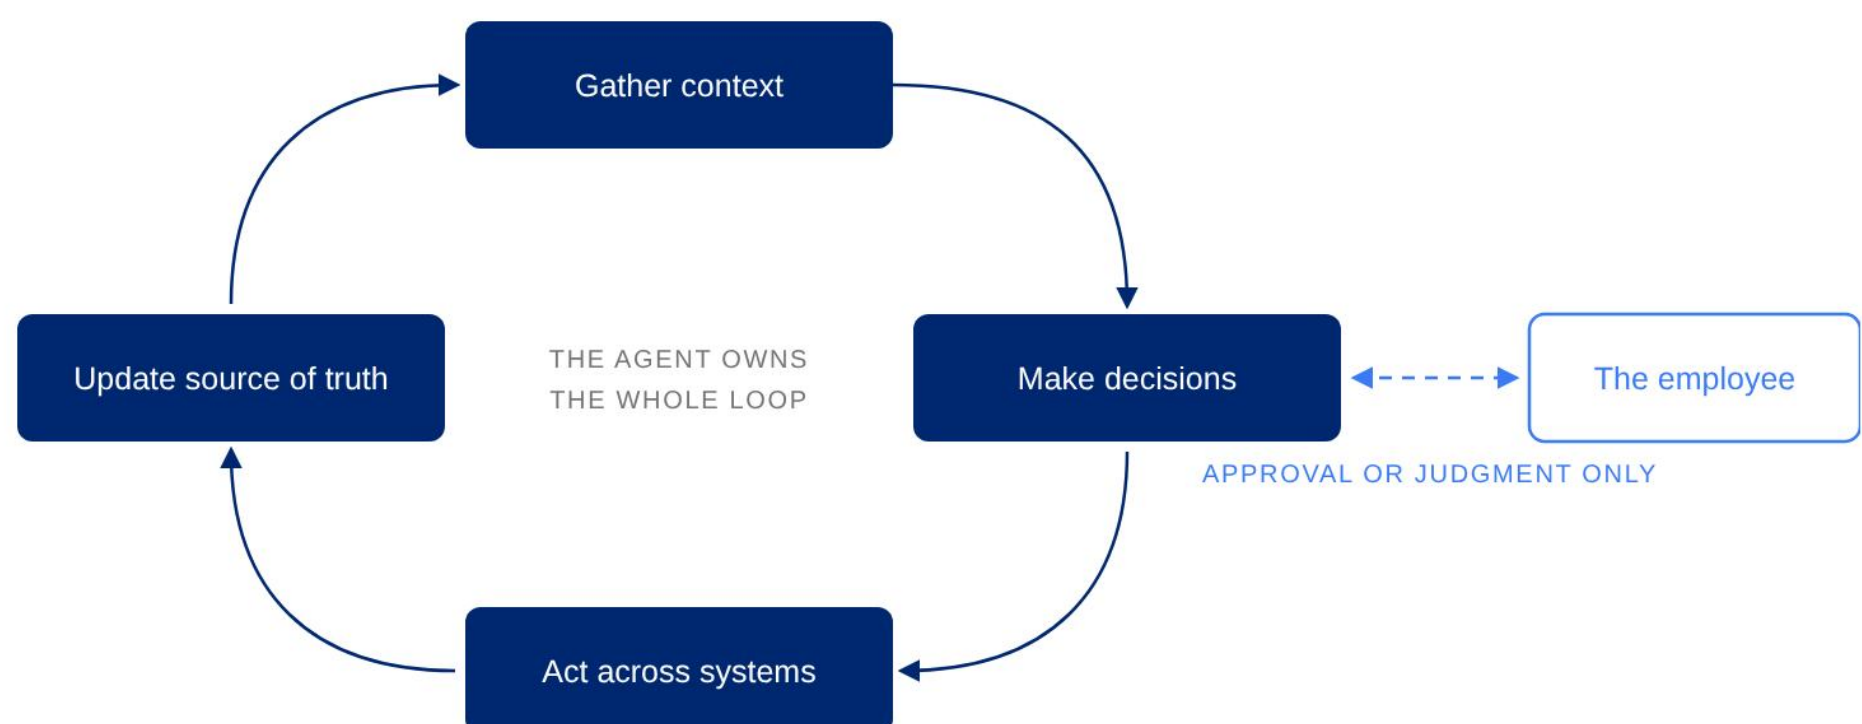

Varick Agents

Give the agent ownership of the full workflow.

It should gather context, make decisions, act across systems, and update the source of truth.

A human should enter only when approval or judgment is required.

Varick Agents

Put the agent where the work already happens.

Run it across the systems, inboxes, and workflows the company already uses.

The employee should receive the outcome, not another interface to manage.

EMPLOYEE

Receives the outcome

AGENT

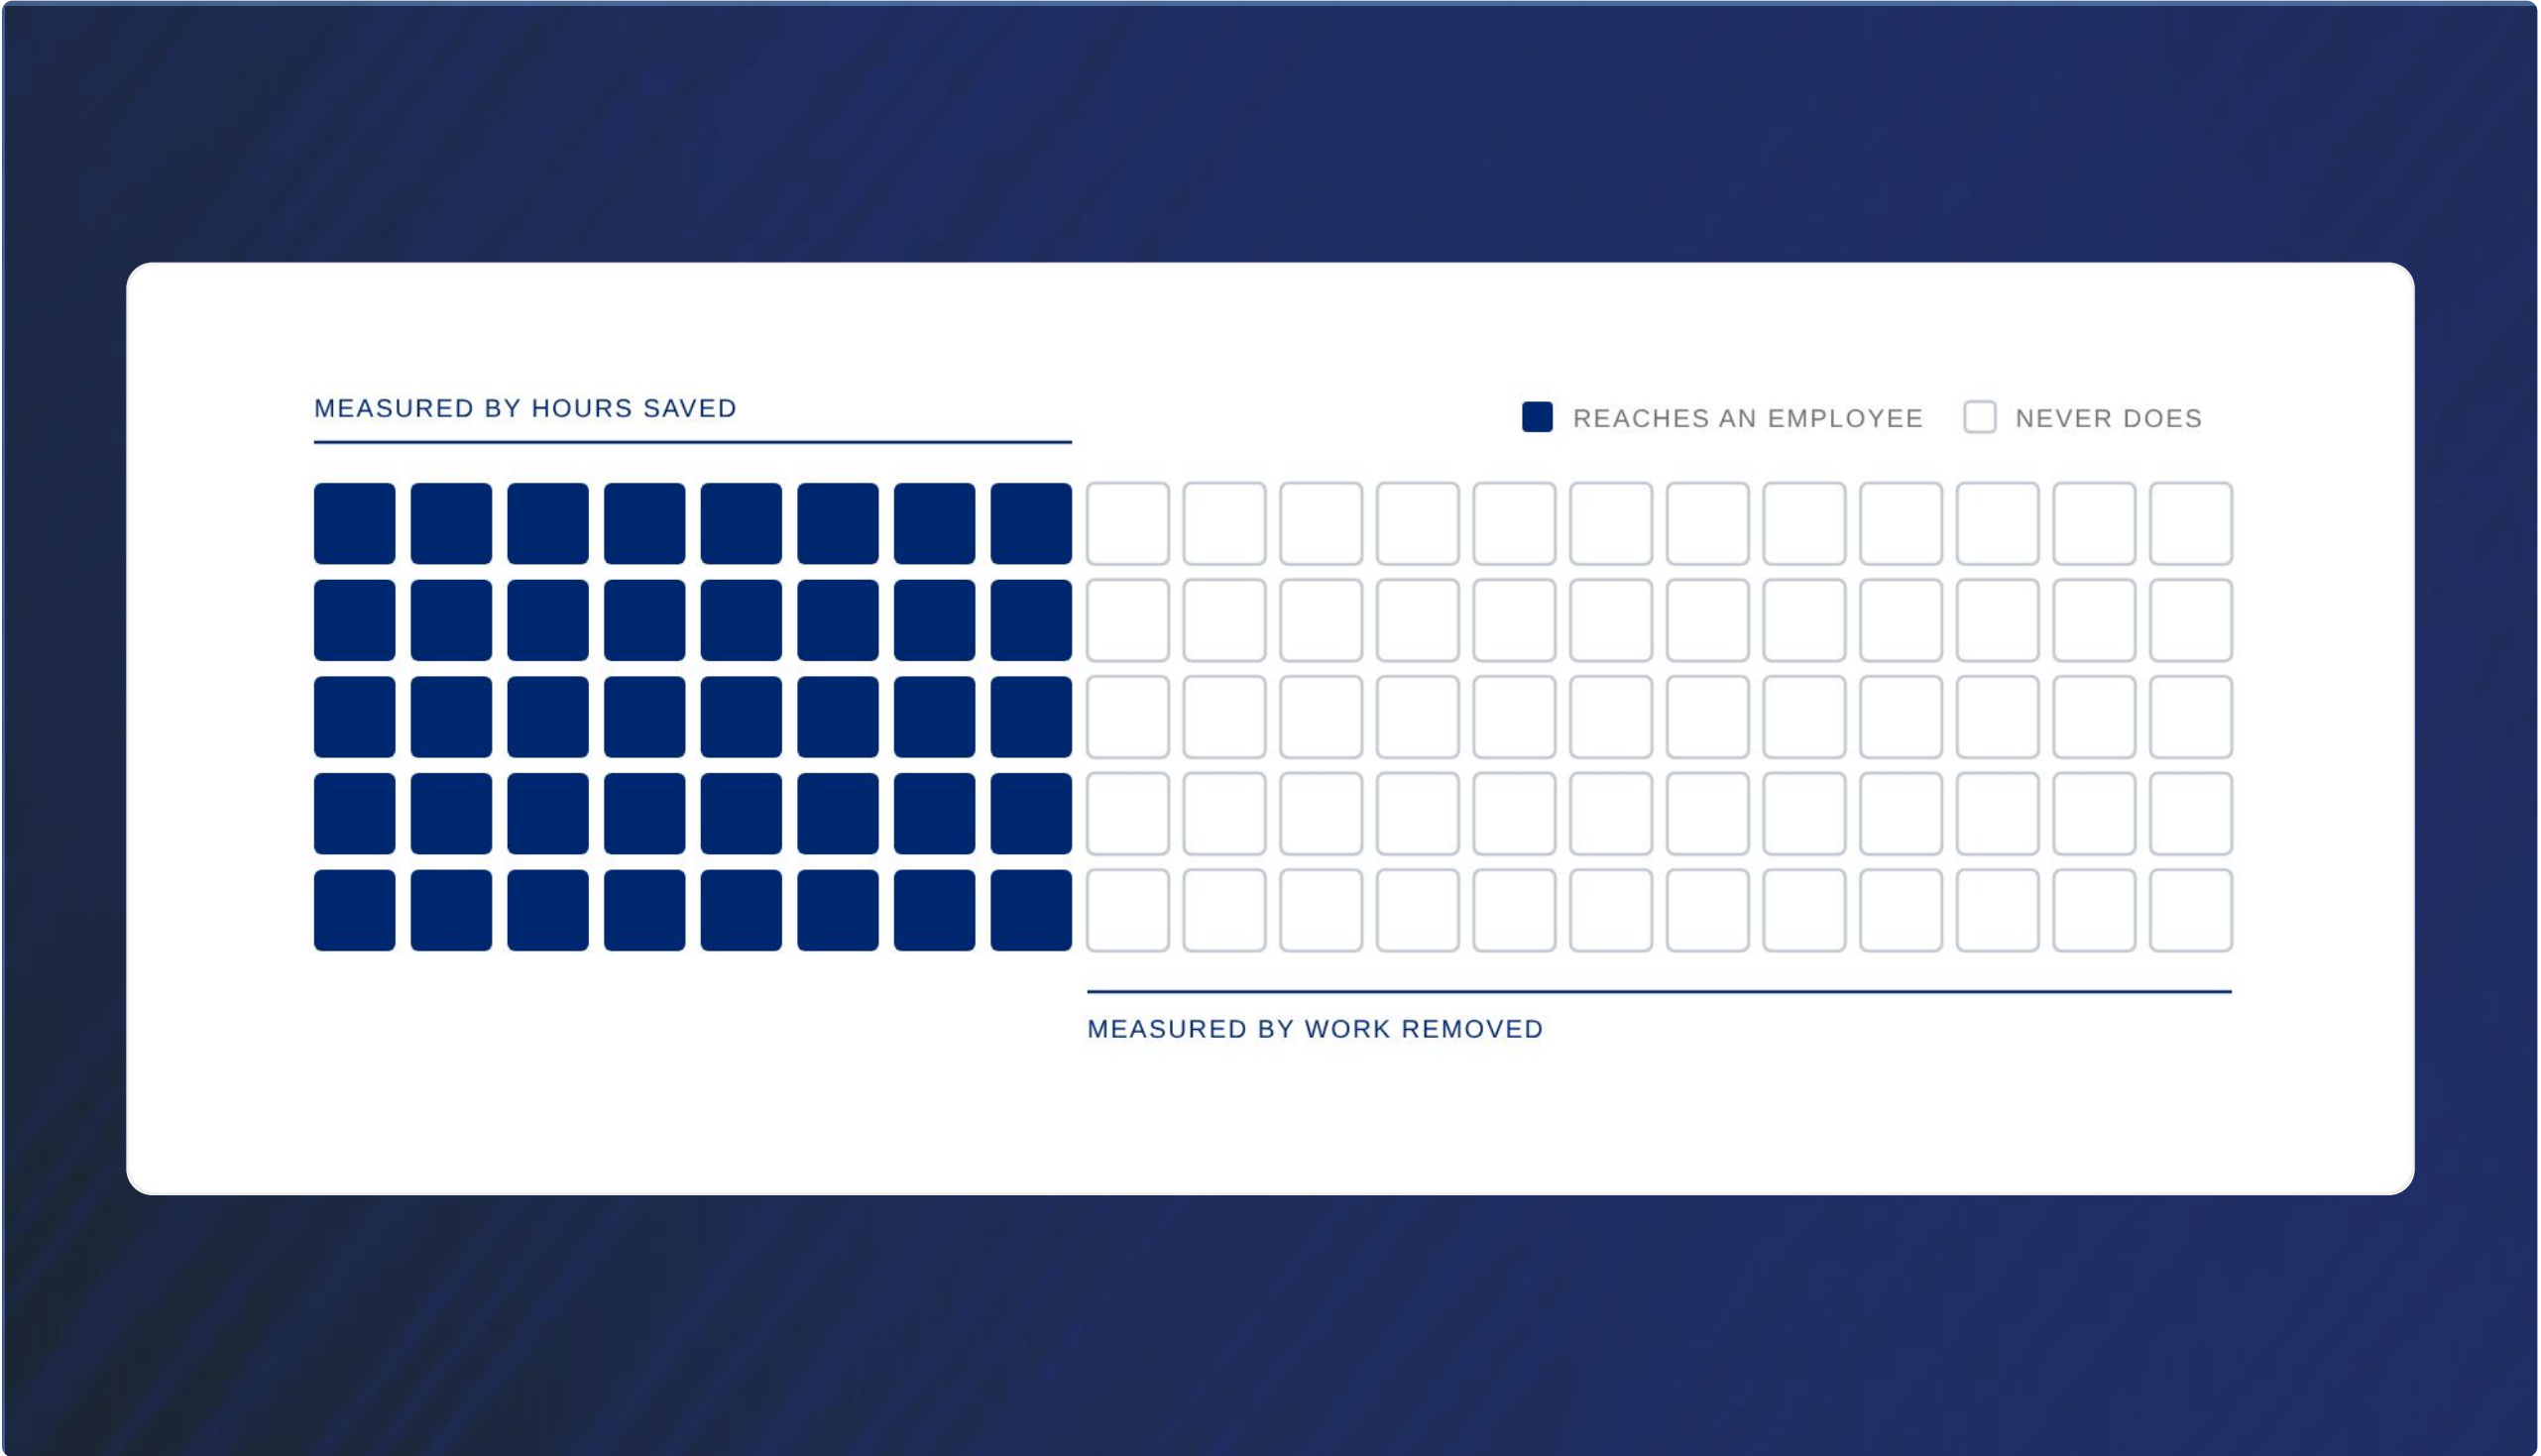

Runs inside these

Measure work removed, not time saved.

Hours saved still assume the employee owns the task.

The better metric is how much work no longer reaches an employee at all.

An abstract background featuring a dark blue field with numerous bright blue, slightly wavy lines that create a sense of depth and movement. A semi-transparent dark rectangle is centered in the middle of the image, containing the text "Varick Agents" in white.

Varick Agents

Do not just make every employee faster.

Remove work from the company.

Claude Code and other copilots can create enormous individual leverage.

But background agents are how that leverage becomes an operating model.
